

Testing Report:

During our testing of the website, we have identified several issues that need attention:

Username Input Validation:

- The username input field exhibits an issue where it requires the input to contain the "@" symbol, which is unnecessary for a standard username. This validation criterion should be revised.

Lack of Clear Input Feedback:

- When attempting to sign in with empty input fields, the system currently displays a message indicating that the inputs are "wrong." It would be more user-friendly to provide a message that explicitly states the inputs are empty, improving user understanding.

Handling Invalid Credentials:

- In cases where incorrect credentials are entered, the website redirects the user to an entirely different page. Instead, it is recommended to implement a more user-friendly approach, such as displaying a popup or a simple text message indicating that the username or password is incorrect.

Button Styling:

- Please review the styling of the sign-in button to ensure it aligns with the website's overall design and user interface guidelines.

Security Check Bypass:

- There is a significant security concern where changing the link (URL path) to the main page bypasses the login process, allowing users to access their accounts without undergoing a proper security check. This is a critical security flaw that should be addressed promptly.
